## Research Interest

My main area of research is software engineering, with a focus on software testing and program analysis. I am also interested in cybersecurity, adaptive systems and mobile computing. I often conduct empirical studies to understand the root causes of various software defects and design techniques to help developers diagnose and fix those defects. My vision is to provide easy-to-use, scalable, and effective tools to help developers build trustworthy, energy-efficient, and high-performance software systems. My work has been published at top software engineering conferences and journals, and has been recognized by several awards and honors including two ACM SIGSOFT Distinguished Paper awards, one ACM SIGSOFT Distinguished Artifact award, one featured article of the IEEE Transactions on Software Engineering, and the Platinum-Level Research Artifact honor at the ACM SIGSOFT International Symposium on the Foundations of Software Engineering. Over the years, my students, collaborators and I have developed and maintained the following tools and datasets, which have been used by researchers and practitioners worldwide:
